

110A Probe Cable

The 110A probe cable is designed to connect the 100 series probes to the 150A amplifier or other instruments. This double-shielded cable has good RF performance from DC to 6 GHz.

Its narrow diameter gives the 110A cable high flexibility, making it convenient and kink-free when using the probes manually.

One end of the cable has a female SMB connector to connect to the probes, and the other end is male SMA. This allows it to connect directly to the 150A amplifier with no adapters.
